

Regional Network

National report

Improved outlook

The enterprises in Norges Bank's Regional Network expect overall activity to increase somewhat ahead. In most sectors, output growth expectations for 2024 Q2 have been revised up since the previous survey. At the same time, construction contacts expect a further fall in activity. Capacity utilisation has risen since the previous survey, and more contacts report labour shortages. Contacts are planning for a slight increase in the level of investment in 2024 and rising growth in 2025. In this survey, contacts have revised up their wage growth estimates for 2024 and 2025 to 5.2% and 4.3%, respectively.

Contacts expect higher activity

Overall, contacts expect rising activity through summer and autumn (Chart 1). There are still wide differences across sectors, although most have revised up their output expectations (Chart 2). Construction contacts expect a substantial fall in activity, while contacts in other sectors expect activity to increase ahead.

Chart 1 Total output growth

Expected growth current quarter and next quarter. Seasonally adjusted. Percent

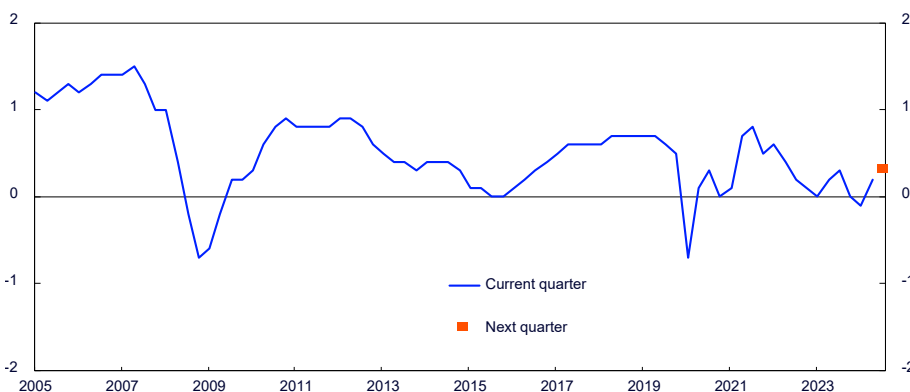

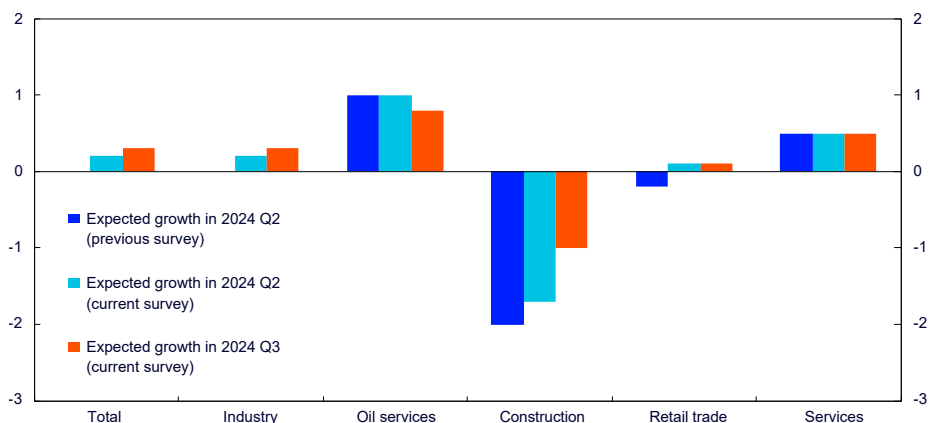

Chart 2 Output growth. All sectors

Expected growth current quarter and next quarter. Seasonally adjusted. Percent

Higher household and business sector demand

Commercial services contacts have revised up activity growth expectations in Q2 and expect growth to remain firm through autumn. IT services contacts expect robust growth, driven in particular by facilitating artificial intelligence and cloud platform services. A number of contacts report rising levels of orders related to energy transition and carbon footprint reduction services. In legal consulting and communications services, contacts also report solid demand. As customers, instead of purchasing services, are hiring new employees to a greater extent than previously, activity growth among some consultancy firms and recruitment agencies is being restrained. Architects and others who work on construction projects have also reduced activity.

Services contacts report growth in household demand, in line with expectations in the previous survey. Contacts expect increased purchasing power owing to high wage growth in 2024 to push up household demand for services through autumn. The krone depreciation has already led to increased tourism, which contacts expect will also boost the popularity of Norway as a holiday destination among Norwegians this summer. Over the past two years, retail trade contacts have reported falling sales volumes. They now expect a slight increase in sales in Q2 and Q3. Consumer goods sales are higher than capital goods sales. However, some car dealerships report a recent slight pick-up in car sales and a steady decline in the number of supply problems. Demand for furniture and home furnishings remains low. Customers are shifting towards cheaper alternatives in most segments of retail trade, and some of the rise in demand partly reflects increased promotional activity in, for example, clothing, sporting goods and the grocery trade.

Continued weak prospects in construction

Contacts still expect a considerable decline in construction in 2024 Q2, although less pronounced than envisaged in winter. Contacts expect

a further, albeit slower, fall in Q3. Many enterprises are working on previously awarded contracts, and in both residential and commercial construction, completions outnumber starts. Some contacts in residential property development now report appreciable sales, but high wage growth, increased material costs and high interest expenses are leading to weak profitability for many projects. As a result, few housing construction projects are being started. Correspondingly, hardly any construction projects are being launched for offices, shopping centres or hotels. For some contacts, however, increased fish farm, data centre and industrial building construction is contributing to growth. A number of contacts report that buildings that previously would have been demolished are now increasingly being rehabilitated. This is primarily for environmental considerations, but also for cost-related reasons. Infrastructure projects are contributing to high output among some construction contractors. Low activity related to foundation work on building lots is dampening growth somewhat.

Growth in oil and renewable energy

Manufacturing contacts expect output to increase in Q2 and Q3. There is still solid growth in demand for products related to energy transition and climate mitigation measures, particularly offshore wind farms. However, a number of contacts point out that the green transition takes time and that some of these projects are high-risk with varying profitability. Defence sector demand is rising sharply, which pushes up activity growth among manufacturers of defence materiel and their subcontractors. Demand for fish is solid, but quotas and disease outbreaks are limiting fishing industry production. Nevertheless, solid profitability is boosting growth among suppliers. Building materials manufacturers continue to report a decline in output despite many already having reduced output substantially. Nor do contacts that supply to the European manufacturing sector, such as producers of steel and cars, see signs of improvement in the period ahead.

Activity is high in oil services. At the same time, capacity constraints among a large share of contacts are still having a dampening effect on growth. Growth in the domestic market appears to be somewhat stronger than in the export market. Much of the growth in the domestic market can still be attributed to the petroleum tax package.

Upward revisions of investment plans

Contacts are planning for a slight increase in investment between 2023 and 2024. The estimate has been revised up from the previous surveys when contacts' responses indicated a decline. Contacts in manufacturing and oil services are planning for increased investment, while contacts in retail trade and services expect investment to be fairly stable. Contacts are investing in particular in climate mitigation measures, digitalisation and data storage. On the other hand, many contacts are holding back investment owing to high investment and financing costs, and a number of contacts have postponed planned projects.

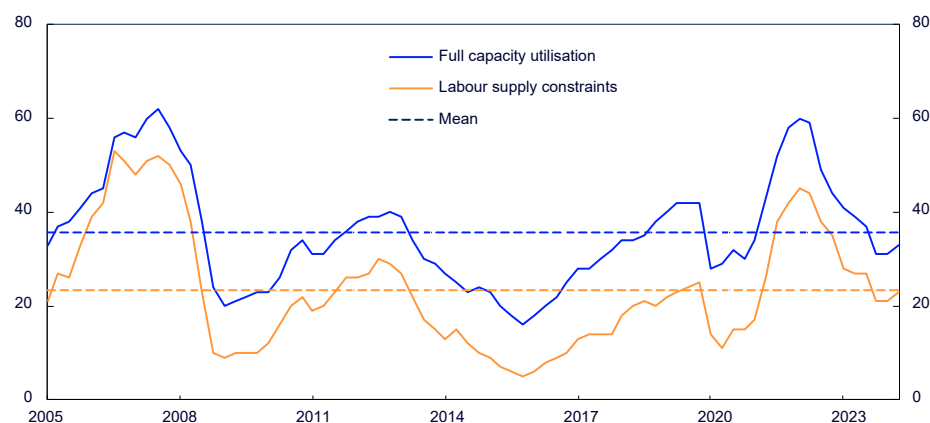

Nevertheless, contacts expect a pick-up in investment growth in 2025. In fishing, contacts are planning for substantial investment and a number of contacts report investment plans in new vessels that can be used in both oil and offshore wind industries.

Higher capacity utilisation

The share of contacts reporting full capacity utilisation has increased somewhat since the previous survey (Charts 3 and 4), and this is the first time in more than two years that this share has risen. In line with this, there are also fewer contacts reporting lower-than-normal capacity utilisation. The share of contacts reporting full capacity utilisation remains somewhat below the historical average. More contacts than in the previous survey report recruitment difficulties, and the indicator for

Chart 3 Capacity utilisation¹ and labour supply constraints²

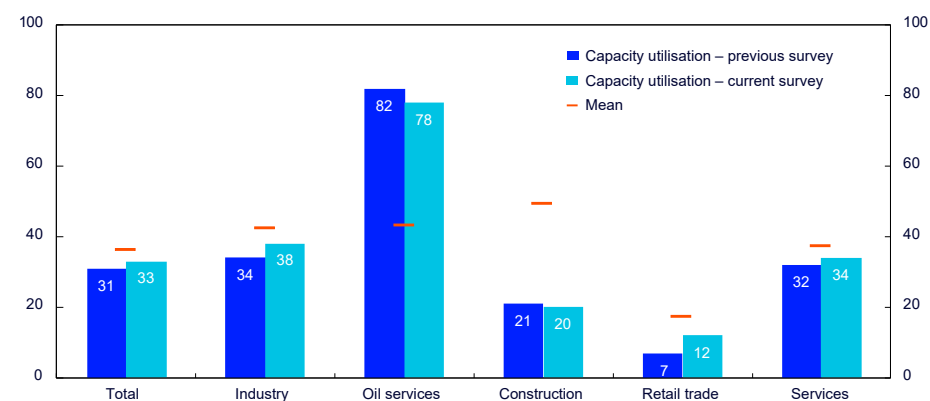

Percentage shares

- 1 Share of contacts that will face some or considerable difficulty increasing output/sales without committing additional resources such as labour or machinery.
- 2 Share of contacts citing shortage of labour as a constraint on production/sales. The question about labour is asked only of the enterprises reporting full capacity utilisation, but the series shows the share of all contacts included in the interview period.

Chart 4 Capacity utilisation¹

Percentage shares

- 1 Share of contacts that will face some or considerable difficulty increasing output/sales without committing additional resources such as labour or machinery.

labour shortages is now at the same level as its historical average. There is a particular shortage of engineers, employees with IT skills and employees with vocational qualifications. In addition, a number of contacts report that it is difficult to recruit foreign labour. This applies, for example, to contacts in travel, ship building and fishing. Contacts are planning for a slight increase in employment in Q2 and expect growth to pick up somewhat in Q3. Contacts in oil services and services are planning for the strongest growth. Contacts cite higher order levels as the main reason for the increase in staffing. A number of contacts also cite the need for skills related to digitalisation and climate policy requirements.

Higher annual wage growth estimates

Contacts expect annual wage growth of 5.2% in 2024 (Chart 5), which is higher than the 4.9% estimate in the previous survey. Wage growth expectations for 2024 have been revised up in all sectors. A large share of contacts cite the wage norm. A number of contacts report difficulties keeping wage growth considerably below the wage norm in the central wage negotiations even though earnings in their own enterprises are weak. At the same time, strong competition for labour within some occupational groups is boosting wage growth. The projection for wage growth in 2025 has also been revised up from 4.0% in the previous survey to 4.3% in this survey. Contacts expect that inflation will be important for wage growth in 2025, and some are concerned that this year's wage settlement will contribute to keeping inflation elevated. Oil services contacts still have the highest wage growth estimates for both 2024 and 2025, while contacts in construction and retail trade have the lowest.

Substantial variation in profitability

Overall, profitability among contacts is slightly weaker than a year ago, but the decline is less than in the previous four surveys (Chart 6). Oil services contacts report a considerable improvement of margins, which primarily reflects higher activity and effective utilisation of production

Chart 5 Annual wage growth

Expected annual wage growth. Percent

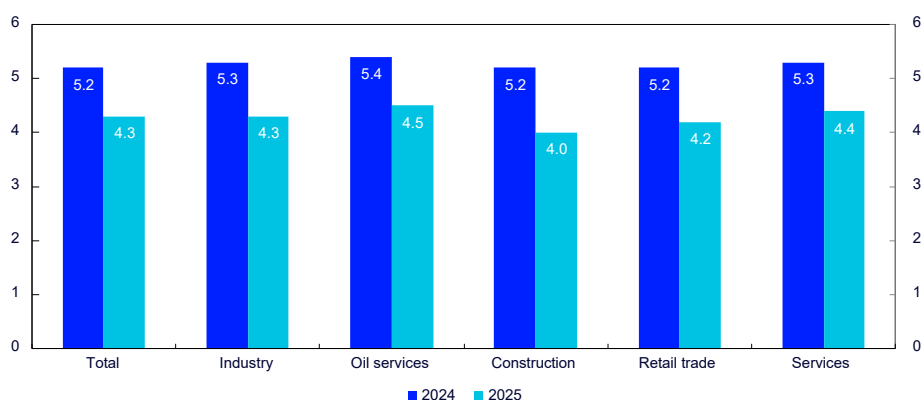

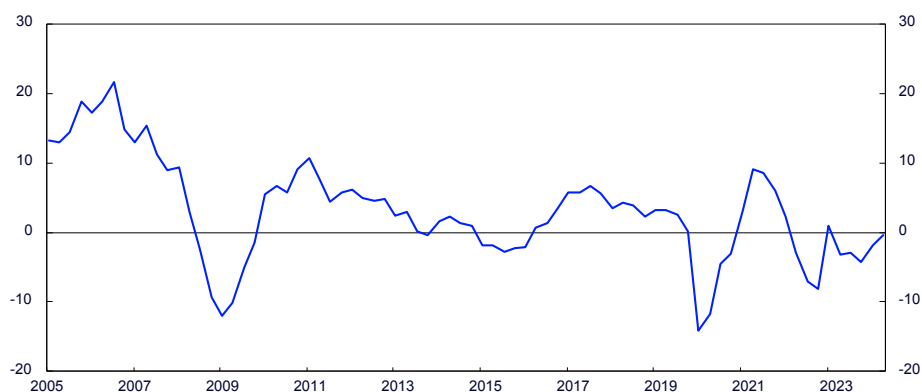

Chart 6 Overall profitability growth

Change in operating margin in the current quarter compared with the same period one year earlier. Percent

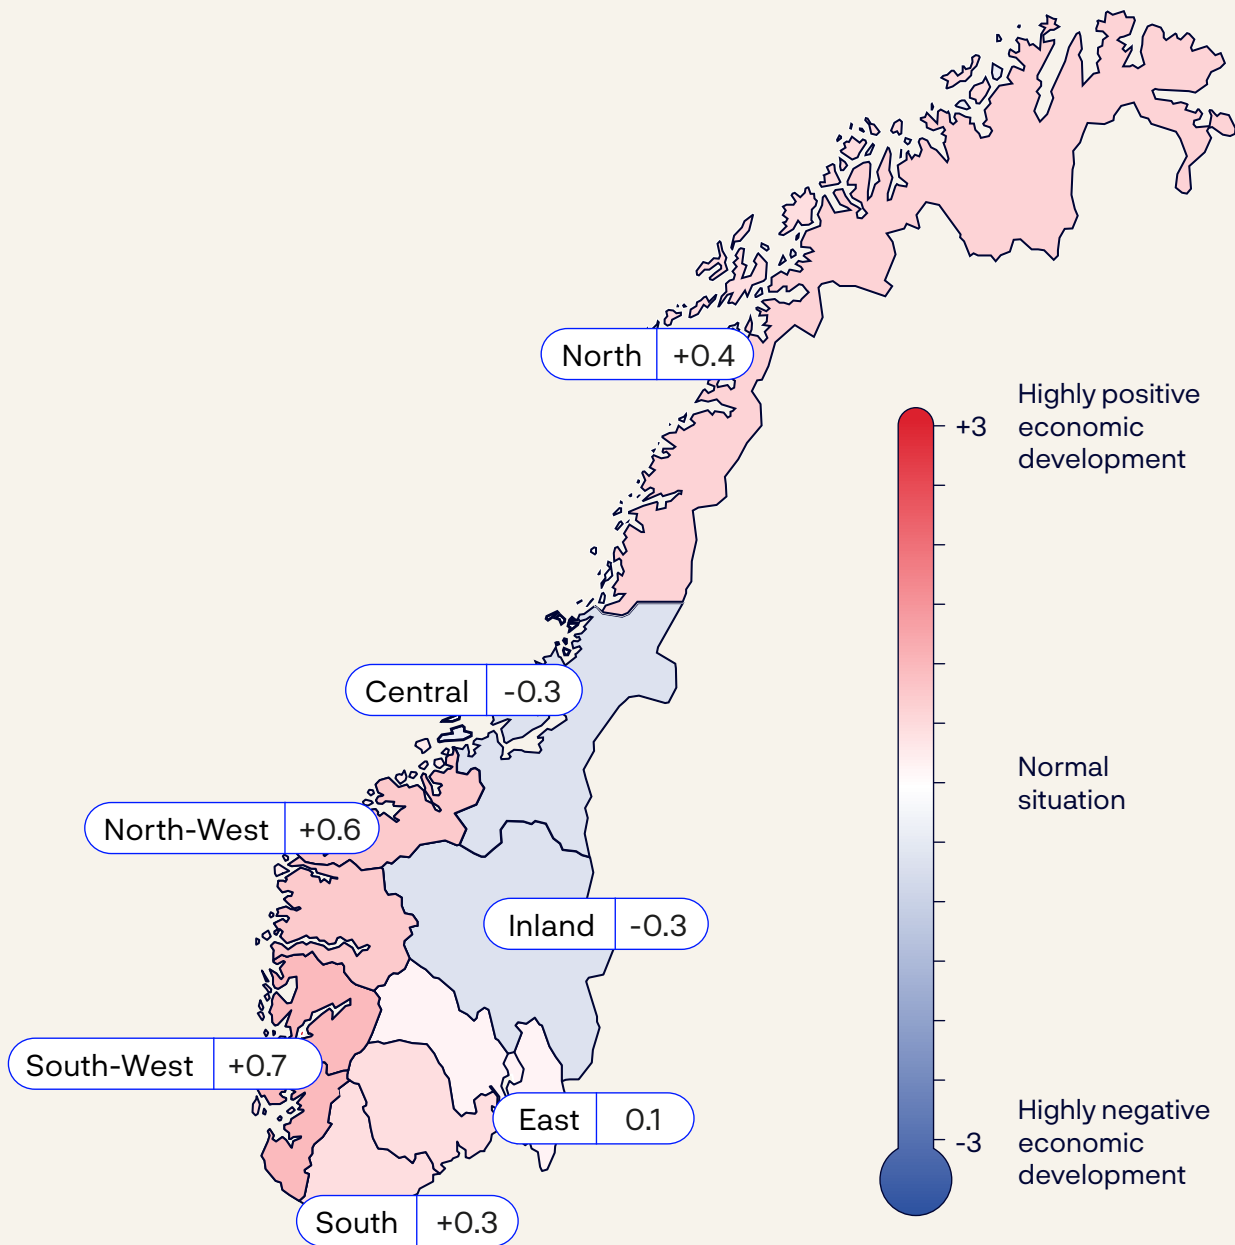

capacity. In addition, profitability among contacts in services and manufacturing has improved. For manufacturing contacts, this is the first time in more than two years that there is an improvement in profitability. A number of contacts attribute the improvement to the fact that they have successfully passed on a larger share of their cost increases to selling prices. Lower activity and substantially higher costs result in a sharp fall in margins among construction contacts and somewhat weaker profitability in retail trade.

Improved economic situation in most regions

Contacts are asked, on a scale between -3 and +3, how they would rate the economic situation of their enterprise in terms of demand, profitability and prospects. A value of zero indicates a normal situation. The regional indicator is an average of the responses in the individual region. The indicator is highest in the western regions and lowest in the regions Central and Inland. Most regional indicators have risen since the previous survey. High activity related to energy production leads to a favourable economic situation for a large share of the enterprises in the western and southern regions. Moreover, in the coastal regions, the regional indicators have been pushed up by the increased willingness to invest in the fishing industry. Increased tourism is also pushing up the regional indicators, particularly in the region North. On the other hand, weak developments in construction are pushing down the regional indicators, most of all in the regions Central, Inland and East.
